Applied forecasting

Ch2. Time series graphics

OTexts.org/fpp3/

Outline

- 1 Time series in R
- 2 Example: Australian prison population
- 3 Example: Australian pharmaceutical sales
- 4 Time plots
- 5 Time series patterns
- 6 Seasonal and subseries plots
- 7 Lag plots and autocorrelation
- 8 White noise

Domestic visitor
nights in thousands
by state/region and
purpose.

tsibble objects

- A `tsibble` allows storage and manipulation of multiple time series in R.
- It contains:
 - ▶ An index: time information about the observation
 - ▶ Measured variable(s): numbers of interest
 - ▶ Key variable(s): optional unique identifiers for each series
- It works with tidyverse functions.

The tsibble index

Example

```
mydata <- tsibble(  
  year = 2012:2016,  
  y = c(123, 39, 78, 52, 110),  
  index = year  
)  
mydata
```

```
## # A tsibble: 5 x 2 [1Y]  
##   year      y  
##   <int> <dbl>  
## 1  2012   123  
## 2  2013    39  
## 3  2014    78  
## 4  2015    52  
## 5  2016   110
```

The tsibble index

Example

```
mydata <- tibble(  
  year = 2012:2016,  
  y = c(123, 39, 78, 52, 110)  
) %>%  
  as_tsibble(index = year)  
mydata
```

```
## # A tsibble: 5 x 2 [1Y]  
##   year      y  
##   <int> <dbl>  
## 1  2012   123  
## 2  2013    39  
## 3  2014    78  
## 4  2015    52  
## 5  2016   110
```

The tsibble index

For observations more frequent than once per year, we need to use a time class function on the index.

```
z
```

```
## # A tibble: 5 x 2
##   Month      Observation
##   <chr>          <dbl>
## 1 2019 Jan           50
## 2 2019 Feb           23
## 3 2019 Mar           34
## 4 2019 Apr           30
## 5 2019 May           25
```

The tsibble index

For observations more frequent than once per year, we need to use a time class function on the index.

```
z %>%  
  mutate(Month = yearmonth(Month)) %>%  
  as_tsibble(index = Month)
```

```
## # A tsibble: 5 x 2 [1M]  
##       Month Observation  
##       <mth>         <dbl>  
## 1 2019 Jan           50  
## 2 2019 Feb           23  
## 3 2019 Mar           34  
## 4 2019 Apr           30  
## 5 2019 May           25
```

The tsibble index

Common time index variables can be created with these functions:

Frequency	Function
Annual	<code>start:end</code>
Quarterly	<code>yearquarter()</code>
Monthly	<code>yearmonth()</code>
Weekly	<code>yearweek()</code>
Daily	<code>as_date()</code> , <code>ymd()</code>
Sub-daily	<code>as_datetime()</code>

Outline

- 1 Time series in R
- 2 Example: Australian prison population
- 3 Example: Australian pharmaceutical sales
- 4 Time plots
- 5 Time series patterns
- 6 Seasonal and subseries plots
- 7 Lag plots and autocorrelation
- 8 White noise

Australian prison population

Australian Pharmaceutical Benefits Scheme

Australian Pharmaceutical Benefits Scheme

The **Pharmaceutical Benefits Scheme** (PBS) is the Australian government drugs subsidy scheme.

Australian Pharmaceutical Benefits Scheme

The **Pharmaceutical Benefits Scheme** (PBS) is the Australian government drugs subsidy scheme.

- Many drugs bought from pharmacies are subsidised to allow more equitable access to modern drugs.
- The cost to government is determined by the number and types of drugs purchased. Currently nearly 1% of GDP.
- The total cost is budgeted based on forecasts of drug usage.
- Costs are disaggregated by drug type (ATC1 x15 / ATC2 84), concession category (x2) and patient type (x2), giving $84 \times 2 \times 2 = 336$ time series.

Working with tsibble objects

PBS

```
## # A tsibble: 65,219 x 9 [1M]

```

Working with `tsibble` objects

We can use the `select()` function to select columns.

```
PBS %>%  
  filter(ATC2=="A10") %>%  
  select(Cost)
```

Selecting index: "Month"

Error: The result is not a valid tsibble.

Do you need ``as_tibble()`` to work with data frame?

Working with tsibble objects

We can use the `select()` function to select columns.

```
PBS %>%  
  filter(ATC2 == "A10") %>%  
  select(Month, Concession, Type, Cost)
```

```
## # A tsibble: 816 x 4 [1M]

```

Your turn

- 1 Download `tourism.xlsx` from <http://robjhyndman.com/data/tourism.xlsx>, and read it into R using `read_excel()` from the `readxl` package.
- 2 Create a `tsibble` which is identical to the `tourism` `tsibble` from the `tsibble` package.
- 3 Find what combination of `Region` and `Purpose` had the maximum number of overnight trips on average.
- 4 Create a new `tsibble` which combines the `Purposes` and `Regions`, and just has total trips by `State`.

Outline

- 1 Time series in R
- 2 Example: Australian prison population
- 3 Example: Australian pharmaceutical sales
- 4 Time plots
- 5 Time series patterns
- 6 Seasonal and subseries plots
- 7 Lag plots and autocorrelation
- 8 White noise

Time plots

```
a10 %>%  
  autoplot(total_cost)
```

Ansett airlines

```
ansett %>%
  autoplot(Passengers)
```

Ansett airlines

```
ansett %>%  
  filter(Class == "Economy") %>%  
  autoplot(Passengers)
```

Ansett airlines

```
ansett %>%  
  filter(Airports == "MEL-SYD") %>%  
  autoplot(Passengers)
```

Your turn

- Create plots of the following time series: Bricks from `aus_production`, Lynx from `pel_t`, Close from `gafa_stock`, Demand from `vic_elec`.
- Use `help()` to find out about the data in each series.
- For the last plot, modify the axis labels and title.

Outline

- 1 Time series in R
- 2 Example: Australian prison population
- 3 Example: Australian pharmaceutical sales
- 4 Time plots
- 5 Time series patterns
- 6 Seasonal and subseries plots
- 7 Lag plots and autocorrelation
- 8 White noise

Time series patterns

Trend pattern exists when there is a long-term increase or decrease in the data.

Seasonal pattern exists when a series is influenced by seasonal factors (e.g., the quarter of the year, the month, or day of the week).

Cyclic pattern exists when data exhibit rises and falls that are *not of fixed period* (duration usually of at least 2 years).

Time series components

Differences between seasonal and cyclic patterns:

- seasonal pattern constant length; cyclic pattern variable length
- average length of cycle longer than length of seasonal pattern
- magnitude of cycle more variable than magnitude of seasonal pattern

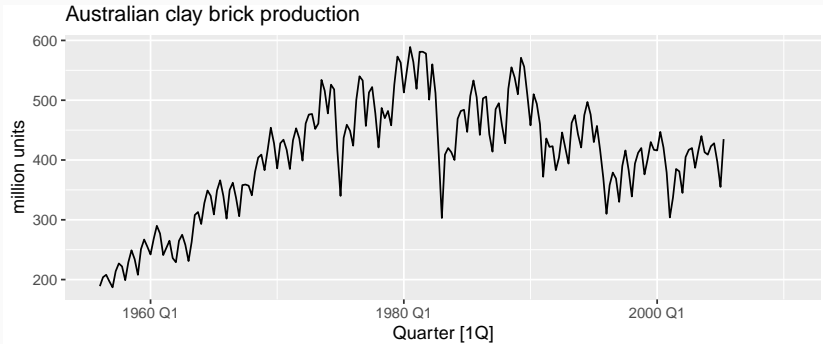

Time series patterns

```
aus_production %>%  
  filter(year(Quarter) >= 1980) %>%  
  autoplot(Electricity) +  
  labs(y = "GWh",  
       title = "Australian electricity production")
```

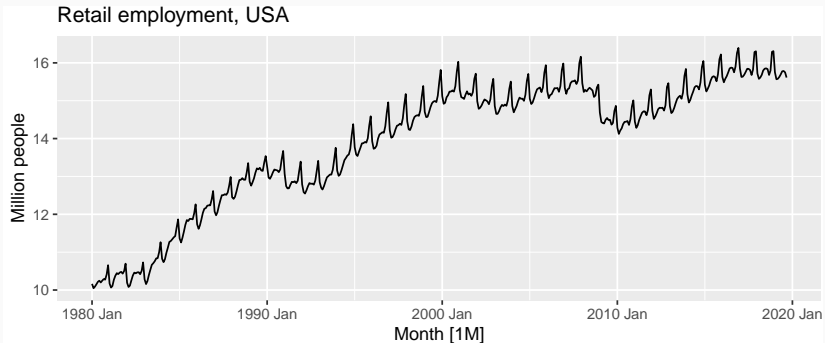

Time series patterns

```
aus_production %>%  
  autoplot(Bricks) +  
  labs(y = "million units",  
       title = "Australian clay brick production")
```

Time series patterns

```
us_employment %>%  
  filter(Title == "Retail Trade", year(Month) >= 1980) %>%  
  autoplot(Employed / 1e3) +  
  labs(y = "Million people",  
       title = "Retail employment, USA")
```

Time series patterns

```
gafa_stock %>%  
  filter(Symbol == "AMZN", year(Date) >= 2018) %>%  
  autoplot(Close) +  
  labs(y = "$US",  
       title = "Amazon closing stock price")
```

Time series patterns

```
pelt %>%  
  autoplot(Lynx) +  
  labs(y="Number trapped",  
       title = "Annual Canadian Lynx Trappings")
```

Seasonal or cyclic?

Differences between seasonal and cyclic patterns:

- seasonal pattern constant length; cyclic pattern variable length
- average length of cycle longer than length of seasonal pattern
- magnitude of cycle more variable than magnitude of seasonal pattern

Seasonal or cyclic?

Differences between seasonal and cyclic patterns:

- seasonal pattern constant length; cyclic pattern variable length
- average length of cycle longer than length of seasonal pattern
- magnitude of cycle more variable than magnitude of seasonal pattern

The timing of peaks and troughs is predictable with seasonal data, but unpredictable in the long term with cyclic data.

Outline

- 1 Time series in R
- 2 Example: Australian prison population
- 3 Example: Australian pharmaceutical sales
- 4 Time plots
- 5 Time series patterns
- 6 Seasonal and subseries plots
- 7 Lag plots and autocorrelation
- 8 White noise

Seasonal plots

```
a10 %>% gg_season(total_cost, labels = "both") +  
  labs(y = "$ million",  
       title = "Seasonal plot: antidiabetic drug sales")
```

Seasonal plots

- Data plotted against the individual “seasons” in which the data were observed. (In this case a “season” is a month.)
- Something like a time plot except that the data from each season are overlapped.
- Enables the underlying seasonal pattern to be seen more clearly, and also allows any substantial departures from the seasonal pattern to be easily identified.
- In R: `gg_season()`

Seasonal subseries plots

```
a10 %>%  
  gg_subseries(total_cost) +  
  labs(y = "$ million",  
       title = "Subseries plot: antidiabetic drug sales")
```

Seasonal subseries plots

- Data for each season collected together in time plot as separate time series.
- Enables the underlying seasonal pattern to be seen clearly, and changes in seasonality over time to be visualized.
- In R: `gg_subseries()`

Quarterly Australian Beer Production

```
beer <- aus_production %>%  
  select(Quarter, Beer) %>%  
  filter(year(Quarter) >= 1992)  
beer %>% autoplot(Beer)
```

Quarterly Australian Beer Production

```
beer %>% gg_season(Beer, labels="right")
```

Quarterly Australian Beer Production

```
beer %>% gg_subseries(Beer)
```

Your turn

Look at the quarterly tourism data for the Snowy Mountains

```
snowy <- tourism %>%  
  filter(Region == "Snowy Mountains")
```

- Use `autoplot()`, `gg_season()` and `gg_subseries()` to explore the data.
- What do you learn?

Multiple seasonal periods

```
vic_elec
```

```

Example: Beer production

```
new_production %>% gg_lag(Beer)
```

Example: Beer production

```
new_production %>% gg_lag(Beer, geom='point')
```

Lagged scatterplots

- Each graph shows y_t plotted against y_{t-k} for different values of k .
- The autocorrelations are the correlations associated with these scatterplots.
- ACF (autocorrelation function):
 - ▶ $r_1 = \text{Correlation}(y_t, y_{t-1})$
 - ▶ $r_2 = \text{Correlation}(y_t, y_{t-2})$
 - ▶ $r_3 = \text{Correlation}(y_t, y_{t-3})$
 - ▶ etc.

Autocorrelation

Covariance and **correlation**: measure extent of **linear relationship** between two variables (y and X).

Autocorrelation

Covariance and **correlation**: measure extent of **linear relationship** between two variables (y and X).

Autocovariance and **autocorrelation**: measure linear relationship between **lagged values** of a time series y .

Autocorrelation

Covariance and **correlation**: measure extent of **linear relationship** between two variables (y and X).

Autocovariance and **autocorrelation**: measure linear relationship between **lagged values** of a time series y .

We measure the relationship between:

- y_t and y_{t-1}
- y_t and y_{t-2}
- y_t and y_{t-3}
- etc.

Autocorrelation

We denote the sample autocovariance at lag k by c_k and the sample autocorrelation at lag k by r_k . Then define

$$c_k = \frac{1}{T} \sum_{t=k+1}^T (y_t - \bar{y})(y_{t-k} - \bar{y})$$

and $r_k = c_k / c_0$

Autocorrelation

We denote the sample autocovariance at lag k by c_k and the sample autocorrelation at lag k by r_k . Then define

$$c_k = \frac{1}{T} \sum_{t=k+1}^T (y_t - \bar{y})(y_{t-k} - \bar{y})$$

and $r_k = c_k / c_0$

- r_1 indicates how successive values of y relate to each other
- r_2 indicates how y values two periods apart relate to each other
- r_k is *almost* the same as the sample correlation between y_t and y_{t-k} .

Autocorrelation

Results for first 9 lags for beer data:

```
new_production %>% ACF(Beer, lag_max = 9)
```

```
## # A tsibble: 9 x 2 [1Q]
```

```
##   lag    acf
```

```
##   <lag>  <dbl>
```

```
## 1    1Q -0.102
```

```
## 2    2Q -0.657
```

```
## 3    3Q -0.0603
```

```
## 4    4Q  0.869
```

```
## 5    5Q -0.0892
```

```
## 6    6Q -0.635
```

```
## 7    7Q -0.0542
```

```
## 8    8Q  0.832
```

Autocorrelation

Results for first 9 lags for beer data:

```
new_production %>% ACF(Beer, lag_max = 9) %>% autoplot()
```

- Together, the autocorrelations at lags 1, 2, ..., make up the *autocorrelation* or ACF.
- The plot is known as a **correlogram**

Autocorrelation

```
new_production %>% ACF(Beer) %>% autoplot()
```

- r_4 higher than for the other lags. This is due to **the seasonal pattern in the data**: the peaks tend to be **4 quarters** apart and the troughs tend to be **2 quarters** apart.
- r_2 is more negative than for the other lags because troughs tend to be 2 quarters behind peaks.

Trend and seasonality in ACF plots

- When data have a trend, the autocorrelations for small lags tend to be large and positive.
- When data are seasonal, the autocorrelations will be larger at the seasonal lags (i.e., at multiples of the seasonal frequency)
- When data are trended and seasonal, you see a combination of these effects.

US retail trade employment

```
retail <- us_employment %>%  
  filter(Title == "Retail Trade", year(Month) >= 1980)  
retail %>% autoplot(Employed)
```

US retail trade employment

```
retail %>%  
  ACF(Employed, lag_max = 48) %>%  
  autoplot()
```

Google stock price

```
google_2015 <- gafa_stock %>%  
  filter(Symbol == "GOOG", year(Date) == 2015) %>%  
  select(Date, Close)  
google_2015
```

```
## # A tsibble: 252 x 2 [1D]
```

```
##   Date      Close

```

Your turn

We have introduced the following functions:

- `gg_lag`
- `ACF`

Use these functions to explore the following time series:

- Bricks from `aus_production`
- Lynx from `pelt`
- Victorian Electricity Demand from `aus_elec`

Can you spot any seasonality, cyclicity and trend?
What do you learn about the series?

Which is which?

1. Daily temperature of cow

2. Monthly accidental deaths

3. Monthly air passengers

4. Annual mink trappings

A

B

C

D

Outline

- 1 Time series in R
- 2 Example: Australian prison population
- 3 Example: Australian pharmaceutical sales
- 4 Time plots
- 5 Time series patterns
- 6 Seasonal and subseries plots
- 7 Lag plots and autocorrelation
- 8 White noise

Example: White noise

```
set.seed(30)  
wn <- tsibble(t = 1:50, y = rnorm(50), index = t)  
wn %>% autoplot(y)
```

Example: White noise

```
set.seed(30)  
wn <- tsibble(t = 1:50, y = rnorm(50), index = t)  
wn %>% autoplot(y)
```

White noise data is uncorrelated across time with zero mean and constant variance.
(Technically, we require independence as well.)

Example: White noise

wn %>% ACF(y)

r_1	r_2	r_3	r_4	r_5	r_6	r_7	r_8	r_9	r_{10}
0.014	-0.163	0.163	-0.259	-0.198	0.064	-0.139	-0.032	0.199	-0.024

Example: White noise

wn %>% ACF(y)

r_1	r_2	r_3	r_4	r_5	r_6	r_7	r_8	r_9	r_{10}
0.014	-0.163	0.163	-0.259	-0.198	0.064	-0.139	-0.032	0.199	-0.024

- Sample autocorrelations for white noise series.
- Expect each autocorrelation to be close to zero.
- Blue lines show 95% critical values.

Sampling distribution of autocorrelations

Sampling distribution of r_k for white noise data is asymptotically $N(0, 1/T)$.

Sampling distribution of autocorrelations

Sampling distribution of r_k for white noise data is asymptotically $N(0, 1/T)$.

- 95% of all r_k for white noise must lie within $\pm 1.96/\sqrt{T}$.
- If this is not the case, the series is probably not WN.
- Common to plot lines at $\pm 1.96/\sqrt{T}$ when plotting ACF. These are the **critical values**.

Example: Pigs slaughtered

```
pigs <- aus_livestock %>%  
  filter(State == "Victoria", Animal == "Pigs",  
         year(Month) >= 2014)  
pigs %>% autoplot(Count/1e3) +  
  labs(y = "Thousands",  
       title = "Number of pigs slaughtered in Victoria")
```

Example: Pigs slaughtered

```
pigs %>% ACF(Count) %>% autoplot()
```

Example: Pigs slaughtered

Monthly total number of pigs slaughtered in the state of Victoria, Australia, from January 2014 through December 2018 (Source: Australian Bureau of Statistics.)

Example: Pigs slaughtered

Monthly total number of pigs slaughtered in the state of Victoria, Australia, from January 2014 through December 2018 (Source: Australian Bureau of Statistics.)

- Difficult to detect pattern in time plot.
- ACF shows significant autocorrelation for lag 2 and 12.
- Indicate some slight seasonality.

Example: Pigs slaughtered

Monthly total number of pigs slaughtered in the state of Victoria, Australia, from January 2014 through December 2018 (Source: Australian Bureau of Statistics.)

- Difficult to detect pattern in time plot.
- ACF shows significant autocorrelation for lag 2 and 12.
- Indicate some slight seasonality.

These show the series is **not a white noise series**.

Your turn

You can compute the daily changes in the Google stock price in 2018 using

```
dgoog <- gafa_stock %>%  
  filter(Symbol == "GOOG", year(Date) >= 2018) %>%  
  mutate(trading_day = row_number()) %>%  
  update_tsibble(index=trading_day, regular=TRUE) %>%  
  mutate(diff = difference(Close))
```

Does `diff` look like white noise?
